

“Create Properties on Followers” and “Hair Morph Template Load”

These tools create empty “blocker” properties on hair or other followers, for any property set as favorite on the parent figure.

To use “Create Properties on Follower”:

- With the target follower loaded and fit to the base figure,
- Select morphs to block by favoriting them on the base figure.
- Run the “Create Properties on Follower” script.
- Select the target follower.
- Set the presentation and set as hidden the created properties.
- Save the created properties (File>Save As>Support Asset>Modifier Assets)

To use “Hair Morph Template Load”:

- This loads a Genesis 9 figure with most of the base properties which would affect hair set as favorite.
- Fit your target follower to this figure and use the “Create Properties on Follower” script.
- You can add or remove from the favorites as needed for your specific follower.
- This does create a large number of empty morphs.
- It would be best practice to limit empty morphs to those which would otherwise affect your follower.

Remember to save the created properties.
